

CT UNDERGROUND FOUNDATION FOR LITTER BIN 60 AND 100

Underground foundation base is used when you need solid installation for your litter bin, use with models CT and Kita, sizes 60 & 100 liters. The base is installed underground so that 10 cm stays above ground level working as a plinth to the bin. Compress the soil carefully and perhaps pour some also inside the base to make it even more sturdy. Normally concrete is not needed. Base height is 400mm and diameter 400mm. Material is powder coated steel and it is usually painted to same color as the bin is.
